HELIXOR MEDTECH

OPERATIONS PERFORMANCE REPORT

European Medical Device Distribution • April–September 2026

Prepared by Thoriq Satrio Ambodo | Junior Data & Operations Analyst | 11 November 2026

PROVISIONAL RESULTS • ILLUSTRATIVE PORTFOLIO CASE STUDY

EXECUTIVE SUMMARY

Provisional On-Time Delivery (OTD) is 23.11%: 110 of 476 eligible completed shipments arrived on or before the promised date; 366 (76.89%) were late. This is the clearest service-performance concern in the current analysis.

All six named warehouses recorded OTD below 30%, with Madrid lowest at 9.09% (5 of 55). In a separate 487-record quantity-eligible subset, Fill Rate reached 97.48%. Lyon had the lowest warehouse Fill Rate (95.35%) and the highest recorded warehouse Damage Rate (1.00%). These are investigation priorities, not proven root causes.

PERFORMANCE SNAPSHOT

ON-TIME DELIVERY 23.11%	110 / 476 eligible completed shipments
QUANTITY FILL RATE 97.48%	108,864 / 111,679 units
LATE SHIPMENTS 366	76.89% of 476 OTD-eligible shipments

WAREHOUSE PERFORMANCE

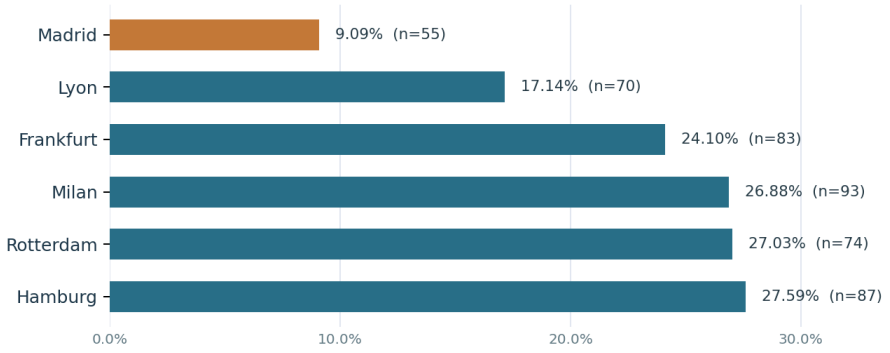

Figure 1. Provisional OTD by named warehouse. Labels show eligible record counts. Fourteen records without a warehouse assignment remain in overall OTD but are not plotted.

KEY PERFORMANCE FINDINGS

01 WAREHOUSE — Madrid recorded the lowest OTD at 9.09% (5 on time, 50 late; n=55). All six named warehouses were below 30%; the pattern does not identify a cause.

02 ROUTE — HAM-DK-02 had the lowest route-level OTD at 12.24% (6 of 49 on time). Route IDs are operational labels; their codes do not establish physical origin or destination.

03 ORDER-MONTH SIGNAL — Madrid recorded 0 on time among 7 April orders and 0 among 9 August orders. These small cohorts show eligible late deliveries, not months without shipments or a confirmed trend.

04 QUANTITY FULFILLMENT — Lyon had the lowest warehouse Fill Rate (95.35%); FRA-SE-03 had the lowest route Fill Rate (95.78%). The unit-weighted analysis covers 487 eligible shipment records, not the OTD population.

05 RECORDED DAMAGE — Milan had the largest damaged-unit count among warehouses (197), while Lyon had the highest warehouse Damage Rate (1.00%). Route HAM-DE-03 ranked highest in both damaged units (132) and Damage Rate (1.26%).

BUSINESS IMPLICATIONS

The low provisional OTD warrants a network-level review, starting with Madrid and HAM-DK-02. Compare promised dates with order and dispatch timestamps, proof of delivery, and transport exceptions to identify where delay occurs. The data does not establish a root cause.

Quantity Fill Rate measures units fulfilled and uses a different eligible population from OTD. The 2,815-unit arithmetic difference between ordered and delivered units requires reconciliation, not a presumption of lost stock. In that same 487-record population, 1,001 damaged units were recorded (approximately 0.92% of 108,864 delivered units). The three indicators identify different operational issues; confirmed customer impact and causes require source evidence.

PRIORITY RECOMMENDATIONS

1. CONFIRM THE KPI BASIS — Reconcile the duplicate row-versus-pair count and exclusion rule; confirm eligibility, missing or invalid records, and status mapping with the Operations and Data Owners. Recalculate after definitions are approved.

2. TRACE DELIVERY PERFORMANCE — For Madrid and HAM-DK-02, match promised dates to dispatch timestamps, proof of delivery and transport exceptions against agreed transit standards.

3. RECONCILE UNIT VARIANCES — Prioritize Lyon and route FRA-SE-03 for comparison of ordered versus delivered units using sales orders, proof of delivery and inventory records. Treat the 2,815-unit gap as arithmetic until verified.

4. REVIEW RECORDED DAMAGE — Compare quality-control and receiving records for Lyon, Milan and route HAM-DE-03; assess damage rates alongside shipment volume before assigning responsibility.

5. ESTABLISH MONTHLY MONITORING — Track eligible counts, OTD, unit-weighted Fill Rate, damaged units and Damage Rate by warehouse and route, using approved KPI definitions and exception categories.

MANAGEMENT DECISIONS & REQUIRED EVIDENCE

Before final performance claims, approve shipment and KPI eligibility rules; confirm how to handle exact duplicate pairs, abnormal dates, quantities and status values. Supply route transit standards, dispatch and proof-of-delivery evidence for Madrid and HAM-DK-02; reconcile quantity differences for Lyon and FRA-SE-03; and check quality-control records for Lyon, Milan and HAM-DE-03. Confirm whether the 14 unassigned warehouse records can be resolved.

DATA CONFIDENCE & LIMITATIONS

This is a provisional descriptive analysis of a simulated 1,000-row assignment, not an audited client SLA or certified operating result. OTD uses 476 eligible shipments; Quantity Fill Rate uses 487 different eligible shipments and is unit-weighted: 108,864 delivered units ÷ 111,679 ordered units = 97.48%. The 2,815-unit difference (2.52%) is arithmetic; no confirmed shortage, customer loss or financial impact is established.

The source also contains missing or invalid dates and quantities, unexpected status and warehouse values, and unresolved records. Two OTD-eligible order dates have no resolvable month, leaving 474 records in the order-month view. Fourteen records lack a warehouse assignment; they remain in overall OTD but are not plotted. Grouped Fill Rate and damage comparisons have been calculated provisionally on the same 487 quantity-eligible records, but are not certified operational results. Damage Rate is damaged units divided by recorded delivered units.

DUPLICATE COUNT CHECK — The raw audit identified 10 exact duplicate pairs (20 involved rows). The OTD eligibility trace excluded 10 duplicate-flagged rows among its 490 date-valid Delivered candidates. Confirm an approved rule for retaining or excluding copies and rerun the metrics; the current 476-record OTD denominator and 23.11% rate may change.
